OBJECTIVE

I'm a frontend developer, I want to develop myself and to be professional in this field. I have many dreams that I want to implement, and this will only come with hard work and effort

PROJECTS

- **Shopsy**

Tech Stack: React.js, Tailwind CSS, React Icons, React Slick, AOS

An e-commerce web application for buying and selling clothes, built to enhance my skills in front-end development. The project features a clean and responsive user interface with support for **dark mode**.

Key Features:

- Developed using **React.js** for building reusable UI components and managing state effectively.
- Styled with **Tailwind CSS**, enabling rapid and consistent UI design.
- Integrated **React Icons** to enrich the visual elements with scalable vector icons.
- Used **React Slick** to implement responsive and smooth image sliders.
- Enhanced user experience with scroll-based animations using **AOS (Animate On Scroll)** library.

This project served as a hands-on practice to explore modern front-end technologies and create a functional and stylish web interface. You can visit the live website from [here](#)

- **CRUDS – Product Management App**

Tech Stack: HTML, CSS, JavaScript

A simple web-based application designed to manage products by performing basic **CRUD operations** (Create, Read, Update, Delete). The app allows users to input product details like price, taxes, discount, and quantity, and it automatically calculates the **total cost** of each product.

Key Features:

- Built using **HTML** and **CSS** to create a responsive and user-friendly interface.
- Used **JavaScript** to handle all dynamic functionalities such as:
 - Adding, updating, and deleting product entries.
 - Performing real-time calculations for total price including taxes and discounts.
 - Managing product data directly in the browser using the **localStorage API** for persistence.

This project helped me strengthen my understanding of JavaScript fundamentals, DOM manipulation, and basic front-end logic. You can visit the live website from [here](#)

- **XO Game**

Tech Stack: HTML, CSS, JavaScript

A classic **Tic-Tac-Toe** game built using **JavaScript**, where players take turns marking spaces on a 3x3 grid. The game checks for a winner or a draw after each turn, and reloads the page to start a new game once the result is determined.

Key Features:

- Developed using **HTML** for structuring the game interface and **CSS** for styling the grid and the game's interactive elements.
- Utilized **JavaScript** to handle the game logic, including:
 - Tracking player turns.
 - Detecting the winning condition (three matching marks in a row, column, or diagonal).
 - Automatically refreshing the page at the end of the game to allow a new round to start.

This project helped me apply fundamental programming concepts like conditionals, loops, and event handling in a practical game environment. You can visit the live website from [here](#)

➤ And you can see all these projects in reality by visiting my portfolio, which contains all the projects and links I have worked on : [My Portfolio](#)

SKILLS

- HTML, CSS, JavaScript, TypeScript
- Tailwind, Bootstrap
- React, Nest.js, Redux-Toolkit
- Framer Motion, AOS
- Git & GitHub

knowledge of :

C++, Node.js, Express.js,
MongoDB, Data Structures

EDUCATION

Law, Cairo University

2022 – 2026

LANGUAGE

Arabic (Native)

English (Limited working proficiebcy)
